	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Import both teams' rosters, starting positions, and scoring settings from a Sleeper league ID. ● Load one week's player projections from a CSV file prepared for the league's scoring format. ● Let the user select one player from each team for a hypothetical one-for-one trade.	**Schedule - (For V2.0+)** ● Evaluate trades across multiple weeks using suitable projections, bye weeks, and player availability. ● Support two for one trades, required roster drops, and explicitly selected replacement pickups. ● Suggest trades that improve both teams and compare multiple offers side by side.
Not Important	**Delegate - (Use a library)** ● Use a JSON parsing library to convert Sleeper API responses into Java objects. ● Use a CSV parsing library to handle quoted fields, commas, and column headers in projection files.	**Delete - (Cut it)** ● Build a machine learning model to generate original NFL player projections. ● Add social feeds, league chat
